Master of Science in Global Logistics

The Master of Science in Global Logistics focuses on emerging markets, transportation and customer care. Students are prepared for careers in global e-commerce and logistics planning, as well as running distribution centers and working in consulting. The curriculum spans the entire supply chain and includes one course each in procurement and operations. Nine of the ten required classes concentrate on supply chain management while the other two center on global management. The degree program includes opportunities to experience the supply chain in action, such as, a tour of organizations that operate in and around the Port of LA and applied projects with manufacturing, retail, and logistics companies. The supply chain programs at ASU are highly ranked by U.S. News and World Report and the world class supply chain faculty teach the classes in the program.
